発行年 (published year) 2013

概要

補助スタッフが同行すると、訪問看護師1人でケアを提供した場合に比べ、看護師がケアの準備・片付け等にかかる時間が短くなり、合計滞在時間も短縮しました。その一方で、利用者との落ち着いたコミュニケーションにかかる時間が長くなり、自身の提供したケアに対する自己評価（ケアの満足度）も高くなりました。

Abstract

In comparison to visits made alone, when accompanied by an assistant, home-visit nurses spend less time preparing for and cleaning up after care and less total time at any one residence. At the same time, the amount of time it took to calmly communicate with the care recipient increased, as did their subjective evaluation of (self-satisfaction with) the care they have provided.
